

In the Claims

Claim 1 (currently amended): A method of forming a field-effect transistor on a substrate, said method comprising steps of:

utilizing a silicon tetrachloride precursor in an atomic layer deposition process to form a buffer layer on said substrate;

forming a high-k dielectric layer over said buffer layer, said high-k dielectric layer ~~comprising being selected from the group consisting of hafnium oxide, zirconium oxide, and aluminum oxide;~~

forming a gate electrode layer over said high-k dielectric layer.

Claims 2-3 (canceled)

Claim 4 (original): The method of claim 1 wherein said buffer layer comprises substantially no pin-hole defects.

Claim 5 (original): The method of claim 1 wherein said buffer layer has a thickness less than approximately 5.0 Angstroms.

Claim 6 (currently amended): The method of ~~claim 2~~ claim 1 wherein said gate electrode layer comprises polycrystalline silicon.

Attorney Docket No.: 0180154

Claim 7 (canceled)

Claim 8 (currently amended): A method for forming a field effect transistor on a substrate, said method comprising a step of forming a buffer layer on said substrate, said method being characterized by:

utilizing a silicon tetrachloride precursor in an atomic layer deposition process to form said buffer layer on said substrate;

forming a high-k dielectric layer on said buffer layer, said high-k dielectric layer comprising being selected from the group consisting of hafnium oxide, zirconium oxide, and aluminum oxide;

forming a gate electrode layer over said high-k dielectric layer.

Claims 9-10 (canceled)

Claim 11 (original): The method of claim 8 wherein said buffer layer comprises substantially no pin-hole defects.

Claim 12 (original): The method of claim 8 wherein said buffer layer has a thickness less than approximately 5.0 Angstroms.

Attorney Docket No.: 0180154

Claim 13 (currently amended): The method of ~~claim 9~~ claim 8 wherein said gate electrode layer comprises polycrystalline silicon.

Claims 14-20 (canceled)
